Trust

For more than 20 years, Broadcast Solutions has delivered mission-critical broadcast and sports technology infrastructures trusted by leagues, federations and confederations around the world.

As a FIFA-listed Video Assistant Referee System Integrator (VSI), our VAR FACTORY is part of a selected group of organizations authorized to design, integrate and deliver professional VAR infrastructures. Today, more than 45 VAR systems worldwide are based on solutions designed, integrated and supported by our team. Trust is not built through technology alone. It is earned through experience, proven processes and long-term partnerships. That is why we work directly with FIFA-certified VAR technology providers as a core integration partner, combining best-in-class technology with real-world operational expertise. From centralized VAR centers to FVS solutions, every system is engineered, tested and supported by the same experienced team — from concept and certification to matchday operations and long-term support. When the game depends on the right decision, trust matters.

Our mission is to provide referees with the tools, processes and support they need to perform at their best.

Support

Technology alone does not guarantee successful refereeing operations. The real difference comes from the people behind the systems. That is why VAR FACTORY combines technical expertise with operational consulting, referee training and long-term support to help federations and leagues get the most out of their officiating environments. From implementation and certification to matchday operations, our team supports every stage of the journey.

With **experts across multiple countries and extensive experience from international VAR projects**, help is always within reach when it matters most. We also believe that developing referees is just as important as deploying technology. From integrated VAR simulators and dedicated training environments to remote monitoring and instructor tools, we provide the resources needed to continuously improve officiating performance.

Flexibility

No two federations, leagues or competitions are the same. That is why every VAR FACTORY solution is designed around flexibility, allowing organizations to choose the operational model that best fits their technical, financial and sporting requirements.

> ***Whether it is a compact FVS deployment, a mobile VAR solution, a referee training environment or a fully centralized VAR center, our modular approach makes it possible to start with the capabilities required today and scale as operational needs evolve.***

As competitions grow, new capabilities can be added without replacing the existing foundation. Additional camera feeds, remote operations, VAR archives, monitoring services or REFCAMs can all be integrated seamlessly into the same ecosystem.

Reliability

> ***In refereeing, every decision counts. That is why reliability is engineered into every solution delivered by the VAR FACTORY.***

We work with industry-leading technology partners and proven workflows to ensure stable performance in demanding live production and matchday environments.
Every system is designed with operational resilience in mind, including redundancy, rigorous testing and quality assurance before deployment. From compact football video support solutions to large-scale centralized VAR facilities, our goal is always the same: dependable performance when it matters most. Reliability also means long-term confidence. Our systems are built to operate consistently over many seasons, supported by experienced engineers and proven support processes that help minimize risk and maximize availability.
